◆ General Business

1. Revenue Growth Rate –

Measures the percentage increase in revenue over a period.

Example: If revenue grew from \$50K to \$60K, the growth rate is $[(60K - 50K) / 50K] \times 100 = 20\%$.

2. Customer Acquisition Cost (CAC) –

The cost of acquiring one new customer.

Example: If a company spends \$10K on marketing and gains 200 customers, $CAC = \$10K / 200 = \50 per customer.

3. Customer Lifetime Value (LTV) – The total revenue a business expects from a customer over their lifetime.

Example: If a customer spends \$100/month for 2 years, $LTV = \$100 \times 24 = \$2,400$.

4. Churn Rate – The percentage of customers lost in a given period.

Example: If a company starts with 1,000 customers and loses 50, churn rate = $(50 / 1000) \times 100 = 5\%$.

5. Net Promoter Score (NPS) – Measures customer loyalty by subtracting detractors from promoters.

Example: If 70% are promoters and 20% are detractors, $NPS = 70 - 20 = 50$.

Sales & Marketing

1. Click-Through Rate (CTR) – Measures the percentage of people who click on an ad or link after seeing it.

Example: An ad gets 1,000 impressions and 50 clicks, so $CTR = 50/1000 \times 100 = 5\%$

2. Cost Per Click (CPC) – The amount paid for each ad click.

Example: An ad campaign costs \$500 and gets 250 clicks, so $CPC = 500/250 = \$2$ per click

3. Return on Ad Spend (ROAS) – Revenue generated per dollar spent on ads.

Example: \$1,000 is spent on ads and generates \$5,000 in revenue, so $ROAS = 5000/1000 = 5\times$

4. Lead Conversion Rate – The percentage of leads that turn into customers.

Example: 200 leads result in 40 customers, so $conversion\ rate = 40/200 \times 100 = 20\%$

5. Sales Win Rate – The percentage of closed deals out of total sales opportunities.

Example: A team pursued 50 deals and closed 10, so $win\ rate = 10/50 \times 100 = 20\%$

E-commerce & Retail

1. Conversion Rate – The percentage of website visitors who complete a purchase.

Example: A website gets 10,000 visitors and 500 orders, so conversion rate = $500/10,000 \times 100 = 5\%$

2. Average Order Value (AOV) – Avg. amount spent per order.

Example: Total revenue is \$50,000 from 1,000 orders, so AOV = $50,000/1,000 = \$50$

3. Cart Abandonment Rate – % of shoppers who add items to their cart but don't complete the purchase.

Example: 1,000 carts are created, but only 600 orders are placed, so cart abandonment rate = $(1,000 - 600)/1,000 \times 100 = 40\%$

4. Return Rate – The percentage of sold items that are returned.

Example: 200 items are returned out of 5,000 sold, so return rate = $200/5,000 \times 100 = 4\%$

5. Stock Turnover Ratio – Measures how often inventory is sold and replaced in a given period.

Example: Cost of Goods Sold (COGS) is \$100,000, and average inventory is \$25,000, so stock turnover ratio = $100,000/25,000 = 4\times$

Healthcare

1. Patient Satisfaction Score – Measures the percentage of positive feedback from patients.

Example: Out of 500 patient surveys, 400 gave positive feedback, so satisfaction score = $400/500 \times 100 = 80\%$

2. Average Length of Stay (ALOS) – The average number of days a patient stays in the hospital.

Example: A hospital records 3,000 patient days for 600 admissions, so ALOS = $3,000/600 = 5$ days

3. Bed Occupancy Rate – The percentage of hospital beds occupied at a given time.

Example: 180 beds are occupied out of 200 available, so bed occupancy rate = $180/200 \times 100 = 90\%$

4. Patient Readmission Rate – The percentage of discharged patients who are readmitted.

Example: 50 out of 1,000 discharged patients are readmitted, so readmission rate = $50/1,000 \times 100 = 5\%$

5. Average Wait Time – The average time a patient waits before receiving care.

Example: Total patient wait time is 2,000 minutes for 400 patients, so average wait time = $2,000/400 = 5$ minutes

Supply Chain & Manufacturing

1. On-Time In-Full (OTIF) – Measures the percentage of orders delivered both on time and in full.

Example: 900 out of 1,000 orders were delivered as expected, so $OTIF = 900/1,000 \times 100 = 90\%$

2. Lead Time – Time taken from order placement to delivery.

Example: An order placed on April 1 and delivered on April 10 has a lead time of 9 days

3. Inventory Accuracy – The percentage of correct inventory records compared to physical stock.

Example: System shows 5,000 units, but physical count is 4,800, so $inventory\ accuracy = 4,800/5,000 \times 100 = 96\%$

4. Fill Rate – The percentage of customer orders fulfilled on the first attempt.

Example: 850 out of 1,000 orders were fulfilled immediately, so $fill\ rate = 850/1,000 \times 100 = 85\%$

5. Overall Equipment Effectiveness – Measures production efficiency based on availability, performance, and quality.

Example: If availability = 90%, performance = 85%, and quality = 95%, then $OEE = 0.90 \times 0.85 \times 0.95 \times 100 = 72.7\%$

Human Resources

1. Employee Turnover Rate – Measures the percentage of employees who leave an organization over a period.

Example: 5 out of 50 employees left, so turnover rate = $5/50 \times 100 = 10\%$.

2. Time to Fill – Tracks the average number of days it takes to fill a vacant position.

Example: It took 30 days to hire a new developer, so time to fill = 30 days.

3. Cost Per Hire – Calculates the average expense incurred to hire each new employee.

Example: \$10,000 was spent to hire 2 employees, so cost per hire = $\$10,000/2 = \$5,000$.

4. Employee Engagement Score – Represents the level of employee commitment and satisfaction based on survey results.

Example: A survey rated engagement at 4 out of 5, so engagement score = $4/5 \times 100 = 80\%$.

5. Absenteeism Rate – Measures the percentage of workdays lost due to unplanned absences.

Example: 20 unscheduled absences occurred out of 200 workdays, so absenteeism rate = $20/200 \times 100 = 10\%$.

Follow @khan.the.analyst | Save for Later

Telecom

1. Customer Churn Rate – Measures the percentage of subscribers who stop using a service over a period.

Example: 50 out of 1,000 subscribers left, so churn rate = $50/1,000 \times 100 = 5\%$.

2. Average Revenue Per User (ARPU) – Calculates the average revenue generated per user.

Example: \$10,000 in revenue from 200 users, $ARPU = \$10,000/200 = \50 .

3. Call Drop Rate – Measures the percentage of calls that disconnect unexpectedly.

Example: 30 out of 1,000 calls dropped, call drop rate = $30/1,000 \times 100 = 3\%$.

4. Network Latency – Represents the average time taken for data to travel across a network.

Example: Data takes 20 milliseconds to travel on average, so network latency = 20 ms.

5. Customer Complaint Resolution Time – Tracks the average time taken to resolve customer complaints.

Example: It took 2 hours to resolve a complaint, resolution time = 2 hours.

Software & SaaS

1. Monthly Recurring Revenue (MRR) – Measures the total subscription revenue earned in a month.

Example: \$5,000 from subscriptions in April, so $MRR = \$5,000$.

2. Annual Recurring Revenue (ARR) – Estimates the yearly subscription revenue based on MRR.

Example: MRR of \$5,000 multiplied by 12, so $ARR = \$5,000 \times 12 = \$60,000$.

3. Customer Churn Rate – Measures the percentage of customers lost over a period.

Example: 20 out of 200 customers left, so $churn\ rate = 20/200 \times 100 = 10\%$.

4. Customer Retention Rate – Calculates the percentage of customers retained over a period, excluding new customers.

Example: 180 customers at end, 20 new, 200 at start, so $retention\ rate = (180 - 20) / 200 \times 100 = 80\%$.

5. Feature Adoption Rate – Measures the percentage of users who use a new feature out of total users.

Example: 50 out of 100 users used a new feature, so $adoption\ rate = 50/100 \times 100 = 50\%$.
